

MeCP2 Responds to H2AK119ub, Not Methylation

At genes where MeCP2 binding increases without methylation change, H2AK119ub gain is the dominant epigenomic signal

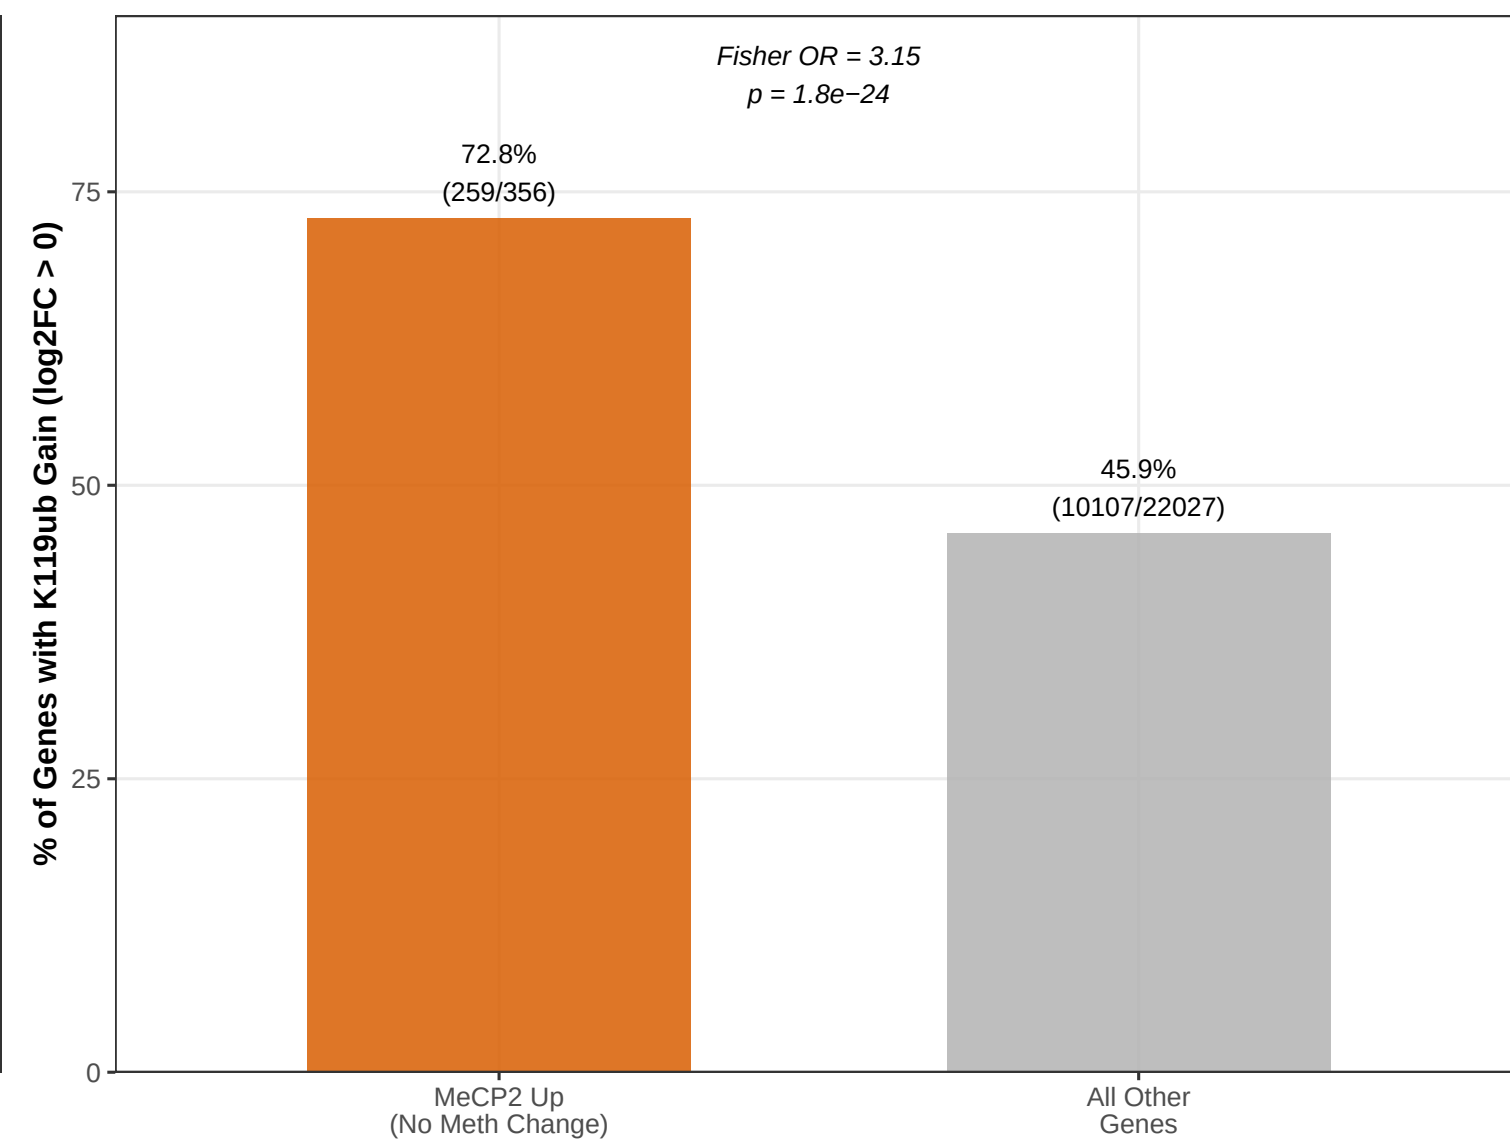

H2AK119ub Signal Change at MeCP2-Bound Unmethylated Genes

MeCP2-no-meth genes (n=356) show significantly higher K119ub gain than genome (n=22,027)

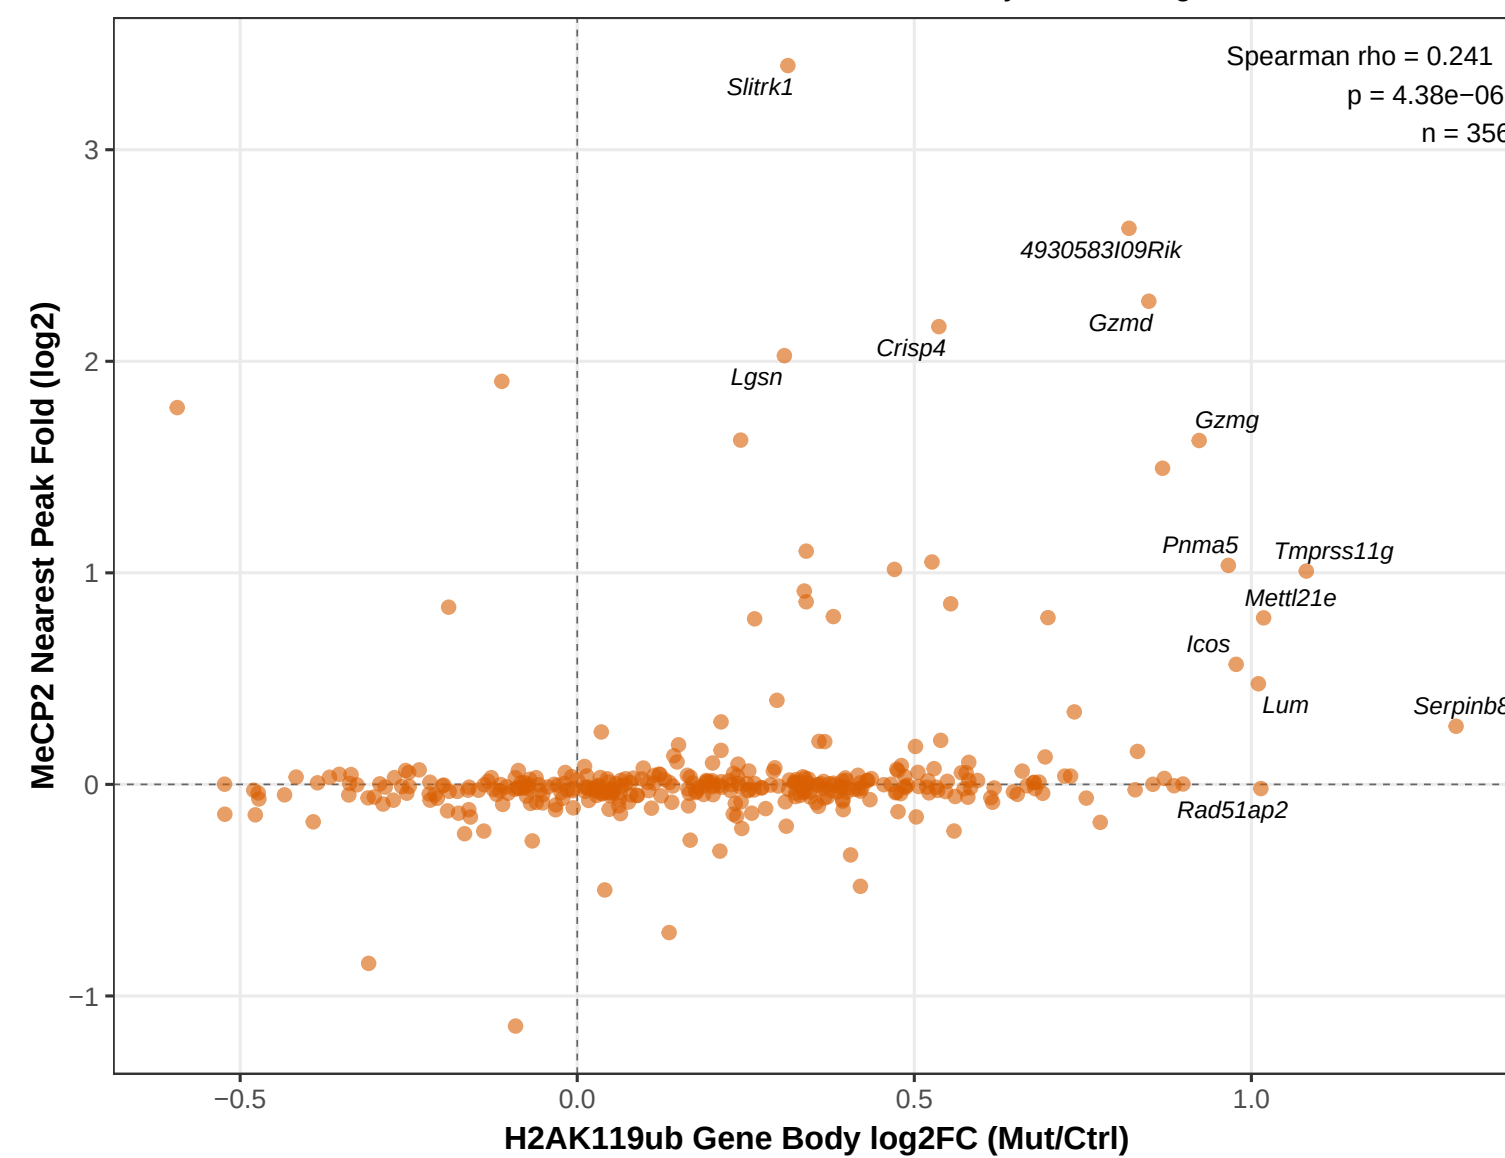

H2AK119ub Gain at MeCP2-Bound Unmethylated Genes

MeCP2 binding changes track with Polycomb mark, not DNA methylation

MeCP2 Fold Change vs H2AK119ub Change (No-Methylation Genes)

Genes where MeCP2 binds without methylation change

Epigenomic Mark Changes at MeCP2-Bound Unmethylated Genes

n = 356 genes | H2AK119ub gain is the dominant signal at these loci
