

Section 72g: Chromatin Remodeling at Neuronal K119ub Loci
BAP1-KO heterochromatin shift is strongest at neuronal genes with high constitutive K119ub

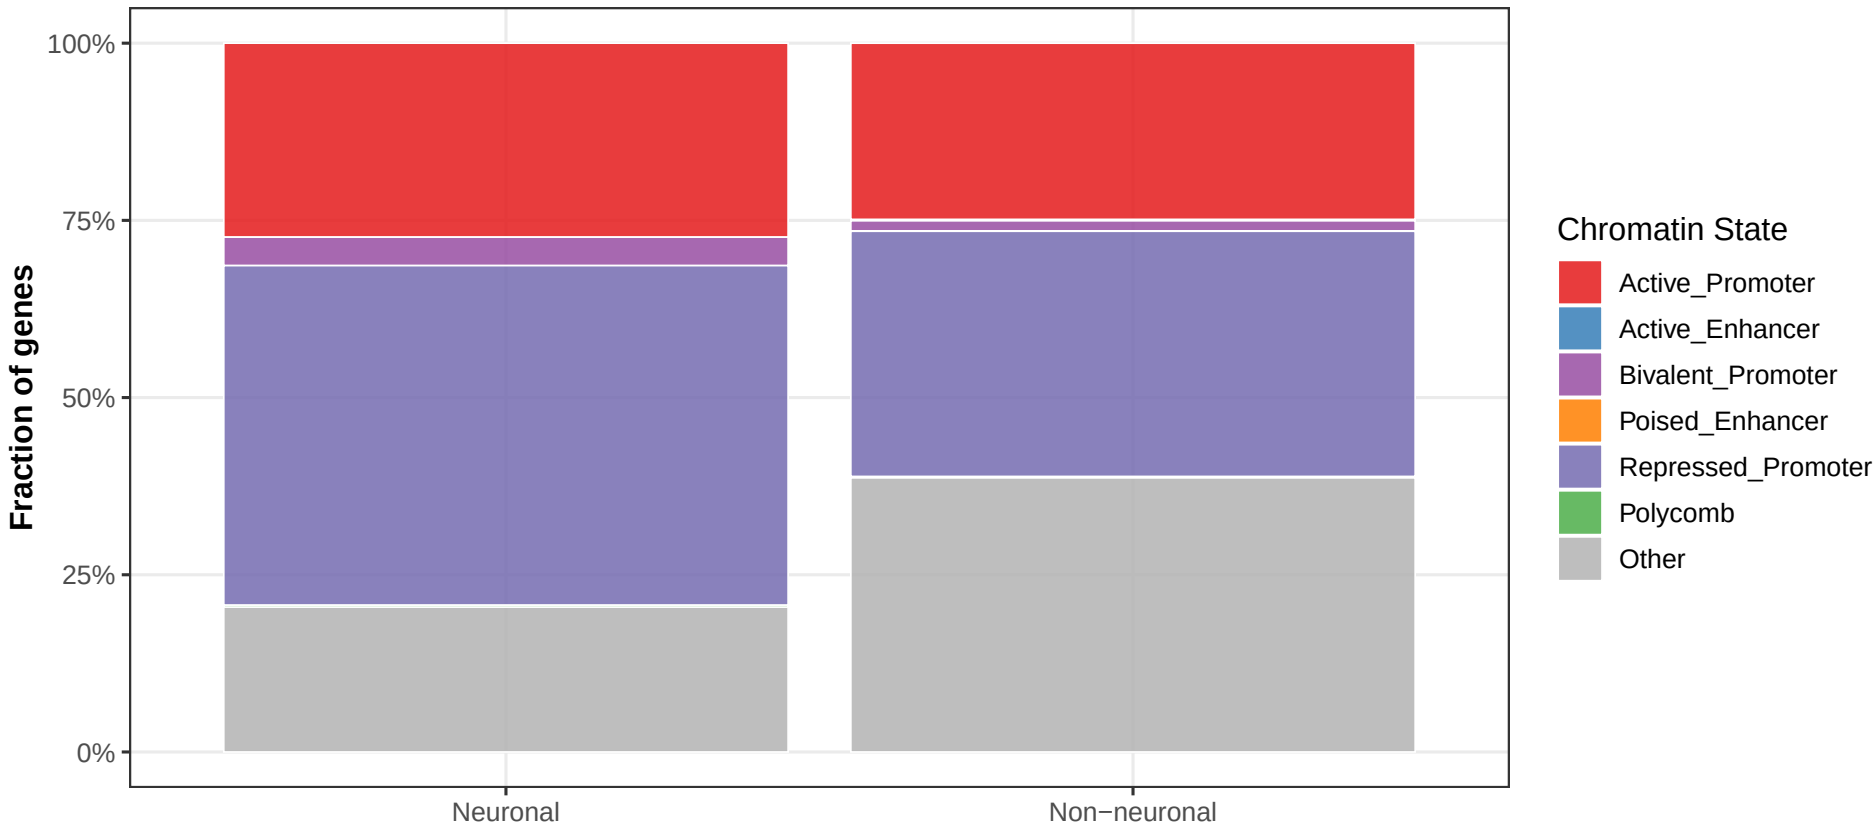

Chromatin mark changes in BAP1-KO: neuronal vs non-neuronal genes

DiffBind log2FC per mark | No MeCP2 filter

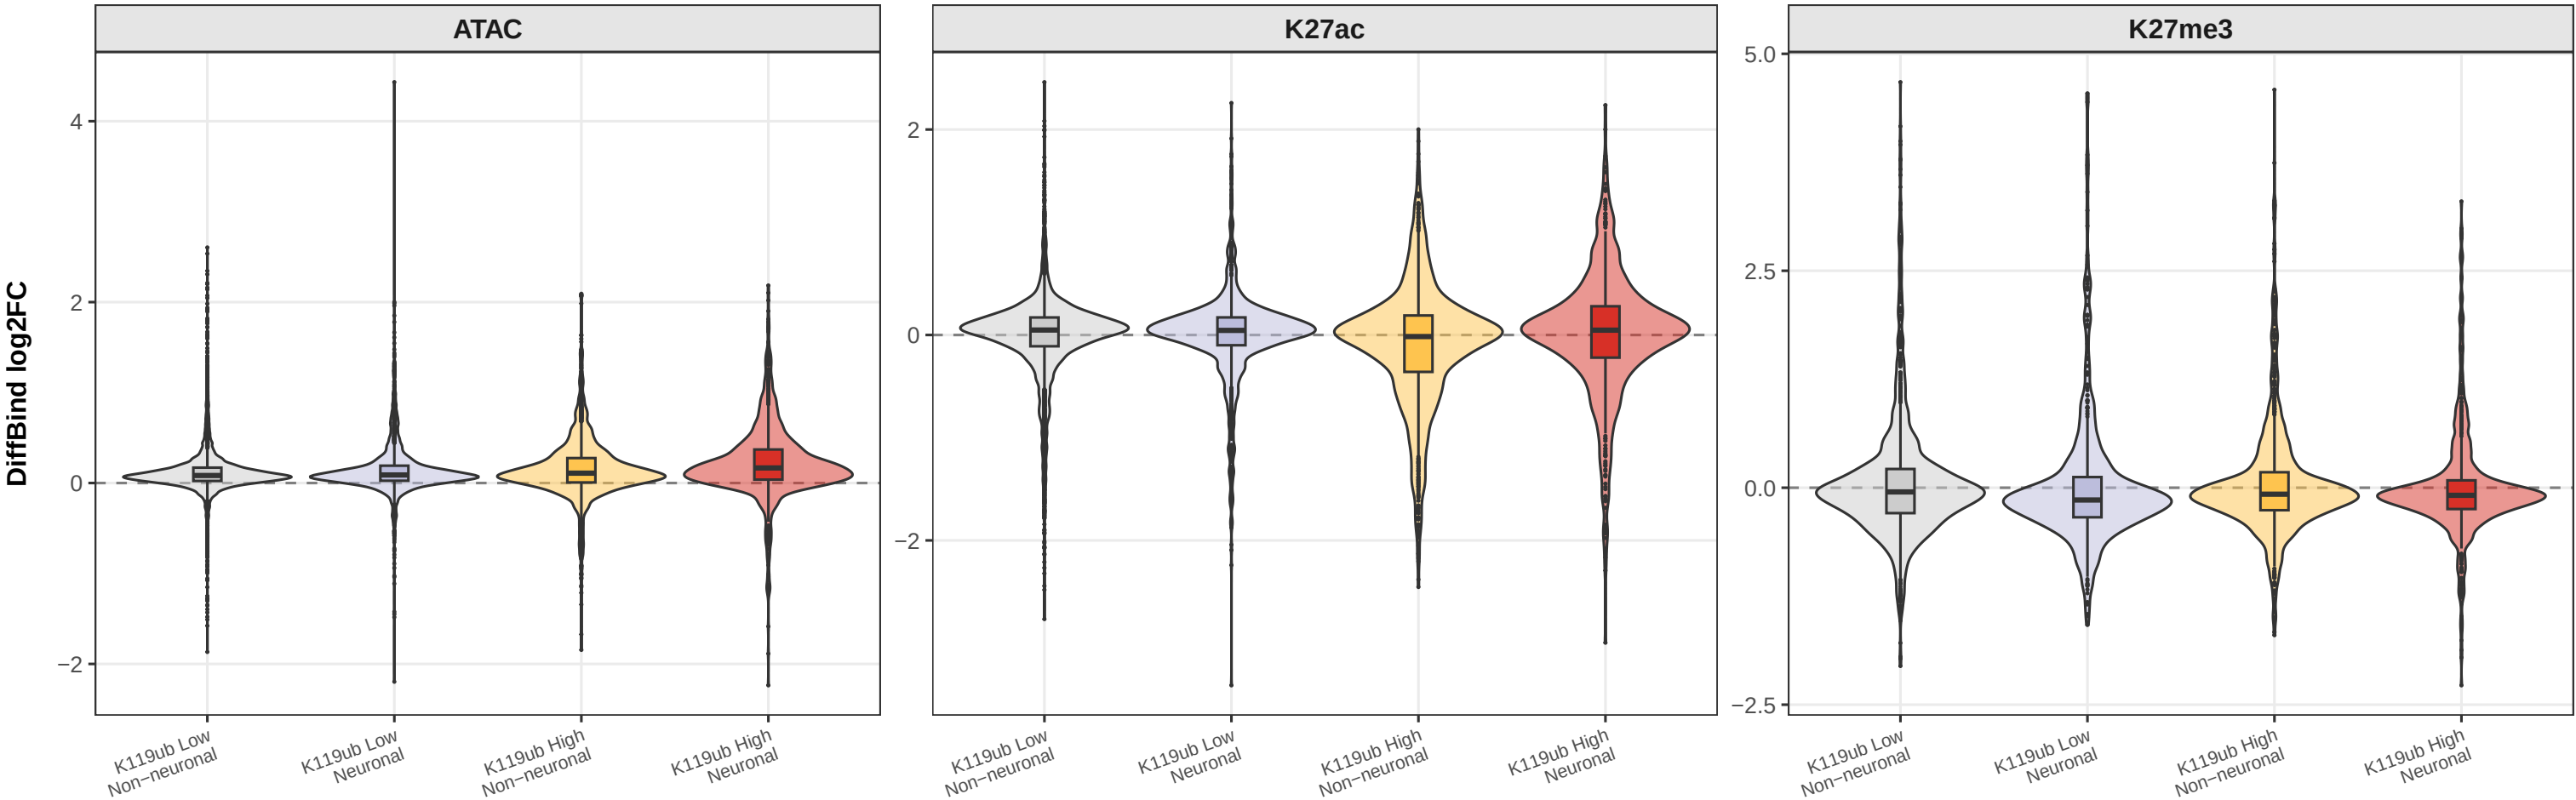

Chromatin state composition: K119ub-high genes

K119ub top quartile | Neuronal: 1418 genes, Non-neuronal: 2917 genes

Chromatin remodeling: K119ub level x neuronal status

K119ub High = top quartile ctrl signal (≥ 1.628) | No MeCP2 filter

Chromatin mark change across K119ub signal deciles

Median DiffBind log2FC per decile | D1 = lowest K119ub, D10 = highest
