

Figure 3 displays two panels of stacked bar charts showing the distribution of genomic features for loops that are down or up in a mutant. The panels are labeled "Down in Mutant" and "Up in Mutant". Each panel contains two stacked bar charts for "All loops" and "≥1 CTCF anchor". The y-axis represents the proportion of loops, ranging from 0 to 1.0. The x-axis labels are "All loops" and "≥1 CTCF anchor".

The "Down in Mutant" panel shows that for "All loops", the majority of loops are associated with the teal segment (bottom), while for "≥1 CTCF anchor", the teal segment is significantly reduced. The "Up in Mutant" panel shows that for "All loops", the majority of loops are associated with the yellow segment (top), while for "≥1 CTCF anchor", the yellow segment is significantly reduced.
