

Linear Model: MeCP2 Fold Change ~ Delta-Ratio + Coverage

Does TET efficiency change predict MeCP2 binding magnitude at significant DMRs?

Linear Model Coefficients

$R^2 = 0.008$, $F(2,9825) = 41.2$, $p = 1.57e-18$

Significance ● $p < 0.05$

Partial Regression: Delta-Ratio Effect

After residualizing out mean coverage
